SST RTR Web Reporting Software
ALARM NOTIFICATION

RTR ECOSYSTEM

The Record To Report (RTR) solution is an easy-to-use, cost-efficient software solution that provides a wide range of features. These include fleet management, fleet status, gas alarms, predictive service notification, email alerts, event logs and unit assignment. Furthermore, it allows the safety manager to utilize the SST Range compliance check function to ensure the units are in use.

Features and benefits

Complete Fleet Visibility
Unlike many competitor systems, RTR provides monitoring of every SST device, SST1, SST4 (Micro&Mini), and SST5, also through the SST Device Link, SST Kiosk, and SST Dock, allowing safety managers to track usage, alarms, and compliance across multiple sites in one unified platform.

Proactive Compliance Management
RTR goes beyond basic reporting by enabling predictive service notifications, automated Compliance Checks, and user-defined alert thresholds, ensuring units are always operational and regulatory standards are met.

Centralized Event Tracking
All alarm events, low gas alerts, and device data are automatically logged and accessible online, giving safety managers a clear overview without manual data entry or separate spreadsheets a feature most competitors lack.

Multi-Site, Multi-User Control
RTR supports complex organizations with multiple sites and multi-level user permissions, giving tailored access to operators, managers, and service teams while maintaining secure centralized data.

Smart Service and Maintenance Planning
The "Needs Attention" list and automated notifications streamline maintenance, spare parts management, and fleet upkeep, reducing downtime and hidden costs compared to competitor platforms.
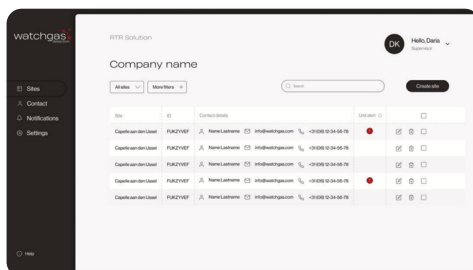

### Web-Based Reliability and Security
Hosted on AWS with daily backups and SSL encryption, RTR delivers 24/7 secure access from anywhere, ensuring your fleet data is safe, always available, and future-proof features that many competitor systems don't provide.

## WatchGas SST RTR Web Reporting Software

WatchGas SST RTR Web Reporting Software provides essential information for safety managers, fleet managers and service teams. This enables them to respond quickly to any alarm events, monitor the health of all devices, and ensure that employees are using the devices properly. The RTR Software allows users to create multiple sites, define action levels, and set up notifications.

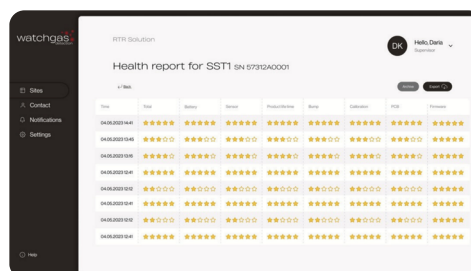

The **Company Page** provides a quick overview of all sites. The Company Admin can set user permissions to limit access and fully tailor the solution to the company's needs.

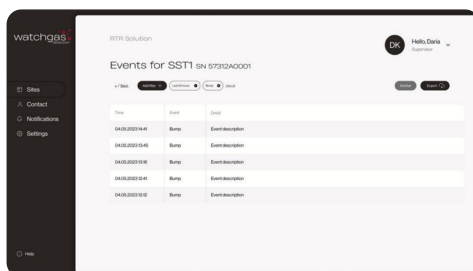

The **Site Page** shows a quick overview of the status of devices assigned to one specific site.

The **All Units on Site Page** displays details of units for a specific site and can be filtered by device type. With adjustable **Service Attention Settings**, users can plan maintenance efficiently to optimize unit use and reduce operating costs.

The **Device Health Report Screen** allows the user to track the health of a specific device and plan any future service actions.

The **Events Screen** allows users to view the full history of device events and search or filter for specific ones.

The **Notification List Page** allows users to configure email and SMS-notifications and define which notifications are sent to specific recipients.
